Customize and Automate: As opposed to other AutoCAD versions, the latest version (2016) includes the capability to work on the drawings at two levels: the feature level and the code level. A feature can be a layout or a tool. Features are generally referred to as 'macros' and refer to sets of instructions that can be used to customise the application to provide a user experience to the extent that the end user doesn't even notice that the application has been customised. Features are created as configurable objects called macros and can be customised to meet the workflow and user requirements. The macros are placed into groups and can be executed either manually, on a schedule, automatically or both. Features can be created by design team in macro language (i.e. AutoLISP, Visual LISP, VBA,.NET, ObjectARX). Features can also be created in object based workflows. For example, an object can be created as a layout that has a macro that will provide the desired user experience (i.e. a layout that can generate a bill of materials). Lastly, using AutoLISP, certain templates can be created (and not needed if the objects are created in ObjectARX). The file format for customised or automated macros and features is 'xml' and can be stored either in the 'MacroStores' or in a CAD database. For example, 'db2' database files can be used to store macros and features. These features can be accessed by a variety of tools and applications for runtime execution. Runtime execution of macros is the final step in the software development cycle. Runtime execution of macros is performed using one of the following approaches: Direct execution – the

software is loaded and the macro or feature is executed. Scheduled execution – the software is loaded but the macro is not executed. Instead, the macro is scheduled for execution at a specified time. Remote execution – the software is loaded, but the macro is not executed. Instead, the macro is executed at a specified time. Execution on client – the software is loaded and the macro or feature is executed. This approach is primarily used for workflows in which the software is stored on the client.

Software development cycle The software development cycle is: Conceptual design Specification and design document preparation Implementation Code completion Code verification Test Continuous quality improvement Production

Use our Customer Survey to tell us what's new in AutoCAD 2020 or AutoCAD LT 2019! Autodesk Design Review 2020 Over the last several years, we've been looking for ways to further simplify drawing by integrating important design features. These features include specialized tools such as non-drafting tools, drafting grids, constraints and more. With AutoCAD 2023, we've developed and introduced a new streamlined user experience that incorporates these important design tools. We've also added two new tools, Design Review and Drafting, to help you go beyond the basics of drawing. We hope these tools will help you create a more flexible and usable design and enhance your productivity. You can learn more about these tools by watching the videos at the top of this page. You can also see the new design for this release in the video below. Design Review Design Review is a new tool for design review. Design Review lets you: Import and organize review comments, with comments grouped by drawing element, comment type and by notes author. Comment on your drawing by adding additional comments and drawing elements, with users only seeing the comments and drawing elements they have permission to edit. Monitor comments for changes in the drawing. Read any comments you've created or are sent to you by an AutoCAD LT, R or 2023 professional user. Modify comments from any document type. Note that all comments and review objects in your drawing are stored in a separate Review Documents folder in AutoCAD LT, R or 2023. (All the comments and review objects you've created in AutoCAD, along with any changes you make to them, are also kept in that folder.) Design Review works best with AutoCAD LT or 2023 because it's designed to
