What's New in the Camelia?

The IDEs have various built-in features and this page explains the most commonly used features. Note: in addition to the features described below, Camelia comes with a standard collection of tools and a basic set of libraries. Camelia supports : Advanced syntax highlighting Live code analysis and code highlighting Source code

navigation Tool-tip with error annotations Debugger and debug view Intellisense, type inference, type constraints, and more How to install: To install the latest version of Camelia, follow the instructions on the download page. (The latest version can be found at the Camelia page on Google code.) To install the latest version of the IDE, run the installer, choose to use an existing configuration, and click Finish. The IDE will then be started and create a default configuration for you. Note: the '`universe`' package may be missing for a recent version of the package. You need to install the '`cabal-install`' tool, then configure

and build your own universe. See the documentation for instructions on how to do this. How to use: The IDEs have an icon on the top left that opens a drop-down menu with a button to start the IDE. Use the IDE by clicking the "`Icon`" button on the drop-down menu. After starting the IDE, click on the top left of the "`Icon`" button to open the menu again. Use the menu items on the top left to start the IDE. See the list of menu items at the bottom of this page. You can also start the IDE by typing "`ocaml`" on the command line. See the list of command line tools at the bottom of this page. How to create an OCaml file: Double

click the "`Icon`" button on the top left of the "`idle`" menu. Double click a blank file. If you want to create a new file from scratch, open the file menu and select "`New File...`". When you create a file from scratch, it is created with the extension ".ml". The file should look like this : > let f (x: 'a) = 1 > > let g x = 1 How to create an OCaml file from an external source: From a file called "input.ml", type: > let f = read_file This will create the file "input.ml" and set the variable "f" to the function "read_file". You can also open the file menu and select "`Open File...`". In this case, you can select "`Text`

System Requirements For Camelia:
