Sacked behind the defenders To create HyperMotion, motion-capture data from a physically active player is tracked through a complete football game, not just in a single match simulation. The player then wears a motion-capture suit and remains active throughout a match of FIFA. As he moves, his movements are collected by the suit, allowing the game to use animation data to accurately replicate the player's movement. Motion-capture data from one player was captured at real speed throughout a comprehensive set of actions from an actual match of 90 minutes of intense football. The data is then used to create player and team animations that are driven by physics. This means that the player makes realistic movements, such as changes of direction, tackles and possession, and the ball makes the type of movements that a human player would make. The end result is that gamers not only control realistic movements, but also work with a more accurate understanding of real-world football. "In FIFA, we've always created animations that are driven by physics, and we thought, 'Why not try to mirror as much of what we see in real football as we can?'" said Steve Nicol, Creative Director of FIFA. "This partnership with XNA gives us a new way to create even more natural animations for our players." "XNA has been used by a number of our partners and we've worked with many of the game developers who use XNA and the Xbox 360 in the past. We're happy

that the team at Visual Concepts made the right choice to use XNA and Xbox 360 as an extension of their own technology, and feel that we are right up to speed on their latest development”, said Mads Woller, President of XNA Worldwide. Relive the action with game-changing camera features XBOX 360 is the only console to feature support for an all-new game-changing camera system. Xbox 360 will offer the best possible viewing angles when playing next-generation FIFA. By using XBOX 360’s game-changing camera system, fans will experience an unprecedented gameplay view with extensive field of view, a zoom-in perspective view when they’re at the 50-yard line and further enhanced coverage. Xbox 360 will also provide fans with the most comprehensive camera angles including “Fade-Ins,” enabling up to eight camera angles to cut seamlessly
