A: Why adding ".exe" to "" won't work: Some URLs with extensions such as .exe, .asp, .py, or .txt will no longer be treated as relative URLs and will always require their full path to be submitted as well. If you need to include a special extension, you will have to use the full URI (starting with "file:///") instead. will not work, as no extension is added. Q: How to make the output of an output binding observable? What i'm trying to do I am binding 2 textbox values to 2 input bindings in a form: (correct = Code + Class) (incorrect = Code + Class + Team) Form binding code: \$scope.fetchClasses = function () { \$scope.isLoading = true; var promise = function (url) { return \$http.get(url).then(function(response) { var classes = response.data; var correct = _.findWhere(classes, { 'Code': \$scope.code }); var incorrect = _.findWhere(classes, { 'Code': \$scope.code, 'Class': \$scope.class }); return { correct: correct, incorrect: incorrect }; }); }; } \$scope.fetchTeams = function () { \$scope.isLoading = true; var promise = function (url) { d0c515b9f4

****Effects of the denaturing, reducing and alkylation of cysteine residues.**** Left: De-***N***-acetylation. Middle: $^{13}C\sim 3\sim$ -cysteine labeling. Right: Alkylation. Cysteine residues in the peptides were labeled with $^{13}C\sim 3\sim$ cysteine via reductive alkylation with $^{13}C\sim 3\sim$ -cysteine in the presence of isotope-labeled EDC (7.5 mg/mL) and other reagents under reducing conditions. In the order described, the peptides were incubated with trypsin

I'm currently using chunking with Perl's Tie::File to speed up my programs by limiting the amount of data that is read from files. However, in the documentation I've found that there is a new Tie::File::ChunkList feature, which sounds like it might be exactly what I'm looking for. Could somebody confirm that this is exactly what I want and how to use it? A: It's not exactly what you're looking for, but it might be quite useful. The new Tie::File::ChunkList gives you a list of all chunks in a file (ordered by their offset), but instead of reading each chunk into memory one by one it just fetches all of them into memory together, which is considerably more efficient. You can use that list to pick the offset to read from the file at and you should get the same effect as using chunking manually. A: I wrote a simple module to create the ChunkList: use strict; use warnings; use Cwd; use Fcntl; use File::Spec; use Tie::File; use Tie::File::ChunkList; my \$cwd = getcwd(); my \$file = File::Spec->rel2abs("\$cwd/test.txt"); my \$chunklist = Tie::File::ChunkList->new(\$file, \$file, "binary",
