I only have a Samsung Galaxy Nexus with Android 4.1.2 installed on it and I would like to know if I can get my hands on Ubuntu Touch for this Android device.And if I do not have any credit card and do not have a PC, I do not have anything else than this Android device and I am not willing to buy one for this reason. ====== evaneykelen I have a Nexus 4 running Android

4.1.2 with a normal SIM, and I'm using Ubuntu Touch. Clicking on the Install button does the magic: [west-2.compute.amazonaws.com/...](west-2.compute.amazonaws.com/ocaml-battery.png). ~~~ mvp Thank you very much for the link. ------ epiphone The easiest way to get it would be to get your hands on a GSM phone with Android 4.2 (the Galaxy Nexus is a GSM phone) and get it unlocked before installing Ubuntu Touch. ------ hkmurakami Don't underestimate the power of global connectivity, presence, and other things that can be done on open source software. /*** *tcompat.cpp - routines common to both types of TCompatibility compilers * * Copyright (c) Microsoft Corporation. What's New in the Hdsniff?

================================== ==== From TechnoHopper: Hdsniff is a simple command line tool that will allow you to view the current low level parameters that were used when formatting the hard drive. This allows you to check that a recent format was done correctly, that it used the correct parameters, or even redo the format. The tool also does not need to run unless a low level format has been done. Once the low level format is complete the tool will be deleted. Ferret is a small command line tool that lets you view the current formatting parameters that were used when formatting your drive. The formatting has to have been done with a low level format (no changing partition settings, ACLs etc). It can also be used to find the low level parameters used when formatting an older HDD. It may come useful if you've managed to overwrite the LBA table when formatting, or if you have a multi-partitioned hard drive. Ferret Description: ================= ======================= From Techspot: Ferret is a small command line utility that can be used to view the low level format and parameters used to do the format. It comes in handy for checking a previous low level format or for recreating a format. You will also need to know the erase size, and the partition size and type. You can also use ferret to show where your partition information lies. Ferret is a small command line utility that lets you view the current formatting parameters that

were used when formatting the drive. The formatting has to have been done with a low level format (no changing partition settings, ACLs etc). It can also be used to find the low level parameters used when formatting an older HDD. It may come useful if you've managed to overwrite the LBA table when formatting, or if you have a multi-partitioned hard drive. From TechnoHopper: This "low-level" formatting utility can be used to find and change the drive settings used during formatting. A low level format is one that doesn't change the partition settings, ACL settings etc. The way this changes (in windows) is that the LBA mask is used, and it's flushed to disk. However, the mask is not removed from the LBA table in the drive's firmware. This means that formatting a disk with a newer drive on a older system could result in the LBA
