This is a proposal to investigate the effect of prior experiences and cognitive-social abilities on the growth and development of young children during the preschool years. Children between the ages of 3 and 6 will be studied, using a longitudinal method of data collection which permits follow-up observations for 1-year periods. The long-term goals of this research are to delineate the nature of the relationships between prior experiences, cognitive-social abilities, and adaptive behaviors that enable young children to develop normally and to understand the potential influences on the normal growth and development of the preschool-aged child. This research is designed to examine aspects of the following areas of interest: (1) factors which characterize normal development during early childhood and what factors in early childhood may produce deviant developmental pathways; (2) the role of prior experiences in child development; (3) the role of cognitive-social abilities as mediating factors between early and later experiences and growth and development; (4) the validity of standard tests of cognitive ability for children 5-6 years of age; (5) the standard tests of cognitive ability that provide accurate and valid assessments of cognitive-social abilities for children from birth to 5 years of age. full_bin_dir_path, wxEmptyString); else return create_dir_or_exe(full_bin_dir_path, bin_name); } } // anonymous namespace String create_dir_or_exe(const File& dir, const String& name) { String cmd; String dir_name = dir.GetDir(); cmd = "cd " + dir_name + " && " + create_bin
