I'm writing a library for some internal systems to insert and retrieve data from a set of files and I am somewhat new to Java and I'm getting told that I am breaking the laws of the The Java Programming Language (Version 5) and 7.7.1 I make the following generic method to insert my generic object into an array of the same generic type. T insert(Class elementClass, T instance) { if (!Collection.contains(elementClass)) { Collection.add(elementClass, instance); } return instance; } I'm concerned that the above code might not be following the laws of the Java Programming Language (Version 5) 7.7.1 because the specification clearly states: A generic type declaration can introduce one or more type variables. The type variables must have type declarations and may not be wildcards. and: The type arguments to a constructor must be of the same type And so my question is whether it is legitimate to use generics in Java and if not, why? Thanks in advance for your input.
