Batman: Gotham Knight. BLEACH:  
World of Blade - Bodyguard.  
Dragonball Z: Ultimate Mission V:  
Legend.Q: When in earth orbit does  
nearest point to sun fall to south? It  
is known that the celestial north pole  
tilts away from the sun when the  
earth is orbiting around the sun. My  
question is that when the earth is at  
the point of it's orbit that it is closest  
to the sun, will the north pole still be  
tilting away from the sun? The  
reason for asking this is that I have

---

noticed that when the earth is at its maximum tilt away from the sun and when it is at its minimum tilt to the sun the north pole seems to be facing the sun from the south. There are two more special points in earth's orbit with respect to the sun. One point has an inclination of 45 degrees to the sun. This point seems to be located at the height of the earth's orbit when it is closest to the sun and when it is farthest from the sun. The other point has an inclination of 0

---

degrees to the sun. This point seems to be located at the earth's peak when it is closest to the sun and when it is farthest from the sun. So my question is will the north pole be tilted away from the sun when the earth is at its maximum (45 degrees inclined) orbit around the sun? Or will the north pole be tilted toward the sun when the earth is at its minimum (0 degrees inclined) orbit around the sun? A: The question is not very clear, but I interpret it to say

---

that if the Earth is at \$t\_2\$ the northern horizon at the moment that it is closest to the sun, then on an orbit that is exactly perpendicular to the plane of the Earth's orbit (in the plane of its orbit around the
